OWMENT The acidic and basic fibroblast growth factors are the major
endothelial-cell growth factors. Both are angigenic agents in
vivo and are potent mitogens for a variety of mesoderm-derived
cell types in vitro (although bEGF is 30-100 times more potent
than aFGF in stimulating the proliferation of normal diploid
cells) There are differences in the tissue distribution and
concentration of these two growth factors.

OWMENT There are some sequence similarities between residues 117-126 (a
region flanked by Lys-Lys dipeptides) and a number of
neuropeptides, including a gastrin-releasing peptide from the pig
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   #authors Risau, W.; Gautschi-Sova, P.; Boehlen, P.

The acidic and basic fibroblast growth factors are the major

endothelial-cell growth factors. Both are anglogenic agents in

vivo and are potent mitogens for a variety of mesoderm-derived

cell types in vitro (although bFGF is 30-100 times more potent

than aFGF in stimulating the proliferation of normal diploid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 proficin binds heparin more strongly than does aFGF. #superfamily fibroblast growth factor alternative splicing; angiogenesis; growth factor; heparin

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. Mean 44.306; Variance 68.544; scale 0.646

-!- FUNCTION: THE HEPARIN-BINDING GROWTH FACTORS ARE ANGIOGENIC AGENTS IN VIVO AND ARE POTENT MITCHESIS IN THE TISSUE DISTRIBUTION AND VITRO. THERE ARE DIFFERENCES IN THE TISSUE DISTRIBUTION AND CONCENTRATION OF THESE 2 GROWTH FACTORS.

-!- SUBUNIT: MONOMER.

-!- MISCELLANEOUS: THIS PROTEIN BINDS HEPARIN, ALTHOUGH LESS STRONGLY THAN DOES BEGE.

-!- SIMILARITY: BELONGS TO THE HEPARIN-BINDING GROWTH FACTORS FAMILY.
15-JUL-1999 (Rel. 38, Last annotation update)
HEPARIN-BINDING GROWTH FACTOR 1 PRECURSOR (HBGF-1) (ACIDIC FIBROBLAST
GROWTH FACTOR) (AFGF) (ALPHA-ENDOTHELIAL CELL GROWTH FACTOR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Eukaryota; Metazoa; Chórdata; Craniata; Vertebrata; Euteleostomi;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Science 251:90-93(1991).
-!- FUNCTION: THE HEPARIN-BINDING GROWTH FACTORS ARE ANGIOGENIC AGENTS
IN VIVO AND ARE POTENT MITOGENS FOR A VARIETY OF CELL TYPES IN
VITRO. THERE ARE DIFFERENCES IN THE TISSUE DISTRIBUTION AND
CONCENTRATION OF THESE 2 GROWTH FACTORS.
